First Milestone

This week I made good progress on my project Hangman game and I am ahead of schedule. I successfully wrote and organized my code and got the core gameplay working. One complication I ran into early on was a Git workflow issue. I started by creating my own folder and files directly in VS Code and writing all my code there, without first cloning the repository that was provided. I ran into problems when I had to push my work because my local folder was not connected to the repository. I was able to fix it by cloning the correct repository and copying all of my code into that new folder, and then I was able to commit and push everything to GitHub. Another thing I struggled with was getting the game to support two word phrases, as I had trouble getting the space to register and display correctly between the two words. After spending some time on it and doing some research, I was able to get it working.

Overall I feel really good about where I am. I think what helped me most was prioritizing my classes in order of when finals were coming up and trying to fully finish everything in one class before moving on to the next. That approach kept me focused and is a big reason why I was able to get this project done so far ahead of time.
